

VOICE INFORMATION STORAGE AND RETRIEVAL SYSTEM AND METHOD

Abstract

5 Methods and systems are provided for allowing a telecommunications
services subscriber to call a voice information application from a wireline or wireless
telephone to allow the subscriber to record and save voice information and access, review
and modify previously stored information such as subscriber contacts information,
emergency telephone directories, business information, and the like. Information may be
10 stored, accessed and modified by the subscriber via the voice information application by
placing a voice telephone call from the subscriber to the voice information application or
by contacting the voice information application via a distributed computing environment
such as the Internet.
